

# Some computational results for generalized pressure Schur complement eigenvalues of the surface Stokes problem

Alexander Zhiliakov\*

February 10, 2019

## 1 Bilinear forms and matrices

We set  $n_{\mathbf{A}}$  to be the number of velocity d.o.f. and  $n_{\mathbf{S}}$  to be the number of pressure d.o.f. Vector stiffness, gradient, and stabilization matrices resulting from Trace FEM discretization of the surface Stokes [1] problem are defined via

$$\langle \mathbf{A} \bar{\mathbf{u}}, \bar{\mathbf{v}} \rangle = \int_{\Gamma} (E_s(\mathbf{u}) : E_s(\mathbf{v}) + \mathbf{u} \cdot \mathbf{v} + \tau u_N v_N) ds + \rho_u \int_{\Omega_h^{\Gamma}} ([\nabla \mathbf{u}] \hat{\mathbf{n}}) \cdot ([\nabla \mathbf{v}] \hat{\mathbf{n}}) d\mathbf{x}, \quad \mathbf{A} \in \mathbb{R}^{n_{\mathbf{A}} \times n_{\mathbf{A}}}, \quad (1)$$

$$\langle \mathbf{B} \bar{\mathbf{u}}, \bar{\mathbf{q}} \rangle = \quad (2)$$

respectively. We set

## 2 Solution description

$n_{\mathbf{A}}$  is the number of velocity d.o.f,  $n_{\mathbf{S}}$  is the number of pressure d.o.f.,  $0 = \lambda_1 < \lambda_2 \leq \dots \leq \lambda_{n_{\mathbf{S}}}$  is the (approximate) spectrum of  $\mathbf{S}$ , and  $r_i$  are the residual norm, i.e.

$$r_i := \|\mathbf{S} \mathbf{x} - \lambda_i \mathbf{M} \mathbf{x}\|_2$$

Note:  $h = 2.6 \times 10^{-2}$  for  $\mathbf{P}_2 - P_1$  (the last mesh level) was computed w/  $\epsilon = 10^{-5}$ , and everything else w/  $\epsilon = 10^{-4}$ . Apparently  $\epsilon = 10^{-4}$  did not work for the finest mesh level:  $\lambda_2$  turned out to be negative for full and normal stabs.
